

LSC Transportation Consultants, Inc. has extensive experience in the design and planning of transit facilities. These facilities include intermodal transit centers, bus transfer centers, bus stops, and bus maintenance and operations facilities.

For transit systems larger than a few routes, the provision of attractive and safe transit passenger facilities is a key ingredient in maximizing ridership as well as operating efficiency. Proper siting and design of transit operational facilities requires an understanding of transit operations, traffic engineering, development regulation, and maintenance functions. LSC provides siting analysis, planning, environmental analysis, project programming, and design for all transit facilities.

LSC has also developed guidelines and criteria for transit facilities. These guidelines can be used by communities to require improvements such as bus stops, bus turnouts, and pedestrian access walkways to support transit operations.
